MRb CRb

 **EuroVent**

Symbols and measurement units used in the catalogue.

$V \text{ m}^3/\text{min}$	= Delivery in m^3/min
$V \text{ m}^3/\text{h}$	= Delivery in m^3/h
$pt \text{ mmH}_2\text{O}$	= Total pressure in $\text{mm H}_2\text{O}$
$pt \text{ Pa}$	= Total pressure in Pascal
$pd \text{ mmH}_2\text{O}$	= Dynamic pressure in $\text{mm H}_2\text{O}$
$pd \text{ Pa}$	= Dynamic pressure in Pascal
$c2$	= Speed in m/s on pressing throat
n	= Fan rounds
Lp	= Noise level indicated in dB/A
P	= Power absorbed in kW
η	= Fan output

Fans constructive executions in conformity with rules UNI EN ISO 13349 (2009).

EXECUTION 1

For belt drive. Wheel keyed overhung. Supports mounted on a base outside the air stream.
Max air temperature 90 °C without cooling fan; 350 °C when fitted with cooling fan.

ESEC. 1

EXECUTION 9

For belt drive. Same as arrangement 1 with motor supported by the side wall of base.
Max air temperature: 90 °C without cooling fan; 350 °C when fitted with cooling fan.
Position of motor W or Z.

ESEC. 9

EXECUTION 12

For belt drive. Same as arrangement 1 with both fan and motor supported by the foundation frame. Max. air temperature: 90 °C without cooling fan; 350 °C when fitted with cooling fan.
Position of motor W or Z (exceptionally X or Y).

ESEC. 12

Plan for motor positioning belt drive.

General concepts about centrifugal fans

The centrifugal fan essentially in a scroll in which a wheel rotates. The wheel's movement is caused by an external energy source, that is usually an electric motor. The main characteristics of a centrifugal fan are:

- a) delivery
- b) pressure
- c) efficiency
- d) rotation speed

DELIVERY

It is indicated by the value of the fluid intaken through the fan in the time unit; normally this is stated by the ratio m³/sec., m³/min., or m³/h.

PRESSURE

It is usually indicated by the ratio kgf/m² or Pa. The pressure generated through a fan is named TOTAL (pt); it is the sum of two different pressures: STATIC + DYNAMIC. The static pressure (p.s.) is the potential energy that wins the circuit resistance when the fluid is passing through the circuit. The dynamic pressure (pd) is the kinetic energy of the moving fluid and it depends on the medium exit speed of the air from the fan throat; the formula is:

$$pd = \frac{C^2}{2g} \cdot 1,226 \quad C = \frac{V}{A}$$

where:

- V = delivery m³/sec.
- A = throat surface m²
- c = medium speed of the air m/sec.
- g = acceleration of gravity (9,81 m/sec)
- 1,226 = air specific gravity kg/m³ at 15°C and 760 mm Hg.

ENERGY

It consists in the ratio between the energy supplied by the fan to the fluid and the energy used by the external source to put in operation the fan. The formula is:

$$\eta = \frac{V \cdot pt}{6120 \cdot P}$$

where:

- V = delivery m³/min.
- pt = total pressure kgf/m²
- P = used energy by the fan indicated in kW
- η = fan efficiency

ROTATION SPEED

It is indicated by the number of rounds per minute: at this speed the wheel must rotate in order to get the required performances. N.B. The following tables show the characteristics of an operating device at air 15°C, barometric pressure 760 mm Hg, specific gravity 1,226 kg/m³, test according to UNI EN ISO 5801:2009 (UNI 10531:1995) rules. If customer wishes get different performances with intermediary value in respect of the value shown in the tables or if he prefers a device operating with air suction at different temperature in respect of 15°C and with different specific gravity in respect of 1,226 we suggest to follow these rules the characteristics of fans change according to the variation in speed rotation and considering the specific gravity of the fluid intaken.

- a) Variation of rotation speed (n) with air specific gravity constant.
- 1. The delivery (V) varies directly with rotations ratio:

$$V_1 = V \cdot \frac{n^1}{n}$$

- 2. The pressure varies with square number of rotations ratio:

$$pt_1 = pt \cdot \left(\frac{n^1}{n} \right)^2$$

- 3. The energy (P) varies with cube of rotations ratio:

$$P_1 = P \cdot \left(\frac{n^1}{n} \right)^3$$

- b) Variations of specific gravity (γ) of the air when rotation speed is constant.

- 1. The delivery (V) remains constant.
- 2. The pressure (pt) and the energy (P) vary directly with the ratio of specific gravities.

$$pt_1 = pt \cdot \frac{\gamma^1}{\gamma} \quad P_1 = P \cdot \frac{\gamma^1}{\gamma}$$

The specific gravity of the air at different temperatures is obtained through the formula:

$$\gamma = \frac{1,293 \cdot 273}{(273+t)} \quad (\text{kg/m}^3)$$

The air density depending on a change of the atmospheric pressure is given by the following formula:

$$\gamma = \frac{Pb \cdot 13,59}{29,27 \cdot (273 + t)} \quad (\text{kg/m}^3)$$

where:

- γ = specific gravity at °C
- 1,293 = specific gravity of the air at 0°C
- t = air temperature indicated in °C
- 273 = absolute zero
- Pb = atmospheric pressure mm Hg

This table shows directly the air specific gravity at different temperatures:

t°C	-20	-10	0	+10	+15	+20	+30	+40	+50	+60	+70	+80	+90	+100	+120	+140	+160	+180	+200	+220	+240	+260	+280	+300	+325	+350
γ	1,396	1,342	1,293	1,248	1,226	1,205	1,165	1,128	1,093	1,060	1,029	1,000	0,973	0,947	0,90	0,85	0,82	0,78	0,75	0,72	0,69	0,66	0,64	0,62	0,59	0,56

Atmospheric pressure depending on altitude above sea-level:

mt	0	500	1000	1500	2000	2500	3000	3500	4000	4500
Pb mm Hg	760	720	680	640	600	560	530	500	470	440

CHARACTERISTICS

The features listed in the diagrams are referred to air at the temperature of + 15°C and at the barometrical pressure of 760 mm. Hg with specific gravity 1,226 Kg/m³.

NOISE LEVEL

The noise level values indicated are expressed in decibel scale A (dB/A) they are understood measured in a free range at the distance of **1.5 m** from the fan operating with the highest output capacity, connected to inlet and outlet pipe connections (rules UNI EN ISO 3740-3744-3746-13347).

ORIENTATIONS

All the fans can be constructed with the delivery mouth in 16 different positions (8 in clockwise rotation RD and 8 in counterclockwise rotation LG) as indicated on the orientation tables. Please note that the direction of rotation is determined by looking at the fan from the transmission side. Some sizes of these fans are revolvable always considering the rotation direction. This information is indicated at the end of the various tables of the overall dimensions. Flange see DIN 24154-24158.

ACCESSORIES (delivery on request)

- **intaking and pressing counterflange;**
- **inspection door:** to inspect and to clean the wheel and the scroll inside;
- **discharge cap:** it eliminates the condensate if any inside the fan and it is situated on the lowest part of the scroll.
- **vibrating proof joints in intaking and pressing time:** they are used to avoid the spreading of vibrations to the pipes;
- **safety grate for intaking throat:** it is used to avoid accidents when the fan is intaking from the room;
- **regulation lock on delivery:** it is used to regulate the fan delivery;
- **regulator of the flow rate in intaking time:** it is used to regulate the fan flow rate and it maintains high the efficiency level, also in regulating time.

SPECIAL CONSTRUCTIONS

Spark proof construction: when explosive fluids are carried or when the plant is installed in dangerous environments, the parts that come into contact with the intaken fluid are constructed by material without iron content to avoid rubbing, motor on request is supplied in special construction.

Corosionproofing construction: when corrosive fluids are carried, the parts that come into contact with the fluid are painted with special paints or they are constructed with special materials as austentic stainless steels (AISI 304-316 etc.),Constructions can be effected according to the customer's particular needs.

SOME VALUES OF AIR SPEED THAT MUST BE OBSERVED INSIDE THE IRON PIPES FOR SUCTION PLANTS, RELATING TO FOLLOWING MATERIALS:

Cereals dust	16–19 m/s
Varnish dust	15–18 m/s
Wooden shaving and sawdust	18–24 m/s
Dry dust of chemicals	17–20 m/s
Coal dust	20–25 m/s
Dust of plastic material working	18–23 m/s
Foundry fumes	15–18 m/s
Lapping sharpening and bufing wheels	20–25 m/s
Fumes of solvents for degreasing	12–17 m/s
Metallic shaving and dust	25–38 m/s
Rubber dust	17–20 m/s
Any toxic dust	15–25 m/s
Zinc oxide dust	18–21 m/s
Saw dust of marble	20–25 m/s
Hides buffing	18–23 m/s

SOME DATA ABOUT THE NUMBER OF THE AIR CHANGINGS FORESEEN IN CIVIL, INDUSTRIAL AND AGRICULTURAL ENVIRONMENTS:

Enviroments	No. changings/hour				
Hen - hutch	8	Hide drying processes	35	Shops	5
Bovine - swine breeding	10	Facrories for rubber production	12	Hospitals	6
Hotel halls -rooms - corridors	4	Factories for alimentary pastes	6	Gymnasiums	20
Garages	8	Factories for chemicals production	15	Baker shops	15
Banks	6	Joineries	6	Swimming-pools	25
Bathrooms - showerbaths	6	Spinning - and weaving mills	5	Dance-halls	20
Galvanic baths	25	Foundries	25	Card-rooms	10
Carpenter shops - welding shops	12	Forge shops	25	Waiting-rooms	10
Heating plants	60	Steam laundries	30	Schools	6
Churches	15	Rooms for electric furnaces	30	Metallurgical works	5
Coffee - houses - bars - restaurants	10	Rooms for furnace	20	Supermarkets	5
Cinemas - theatres	15	Warehouses for perishable goods	15	Dyeing plants	30
Dye works	15	Warehouses for unperishable goods	5	Printing shops	20
Tanneries	18	Tobacco manufactures	12	Toilettes	30
		Grinding mills	20	Technical departments	15

series **MRb** SPECIFICATIONS

USE:

the high output centrifugal fans of this series are suitable for the suction of dusts, fumes, granulates, sawings or also wooden shavings of minimum sizes and materials in general mixed with air excluding filament material.

Their main feature is that of joining up the high output (deriving from the use of a fan wheel with reversed blades, special profile) with the suitability of transporting materials mixed with air. Besides, these fans are distinguished by a very flat curve of the absorbed power, such as to not overload the motor neither when working with free throats.

They are assembled in carpenter shops, mechanical industries, cement factories, ceramic factories, tanneries, foundries, in the molinary and chemical industries, and in all those applications where it is necessary to transport harmful air with max. temperature of 90°C.

For temperatures of the transported fluid higher than 90°C up to 350°C a small heat stopping fan is splined to the shaft between support and scroll; besides the fan is painted with a special aluminium paint suitable for high temperatures.

series **CRb** SPECIFICATIONS

USE:

The centrifugal fans of this series are suitable for the suction of wooden shavings, paper offcuts and filament material in general.

The wheel has radial blades and it is open.

The curve of the absorbed power increases to the free throat and it is suggested to choose a motor with 25% power in addition, in order to rectify errors, if any, in valuation of circuit leaks.

They are assembled in carpenter shops, tanneries, paper, factories, bookbinderies and in all those applications where a normal wheel can be easily obstructed.

Fan Specification

Technical Data Information		
Model	m ³ /min	
Air volume	mm Wg	
Staic pressure	mm Wg	
Total pressure	°C	
Service Temperature	rpm	
Fan speed	KW	
Motor	%	
Efficiency		
Colour (Standard Green)		
Qty .	Set	
Construction		
Type	☐ Centifugal ☐ Axial ☐ Propeller ☐ recommended by vendor	
Power Transmission	☐ Direct ☐ Belt ☐ recommended by vendor	
Position (see table 1)		
Accessory	☐ Inlet Damper ☐ Outlet Damper ☐ Filter ☐ Expansion joint ☐ Inspection Hole ☐ Drain with plug	
Application		

if replace for old blower please give original information.

** Do not use direct drive for hot air fan

This information above is for guideline only , fan supplier should re-check and select the proper solutions.
